	IEC/EN 60529		
Clause	Requirement – Test	Result	Verdict

Test item particulars	:
- Classification of installation and use	: Class I
- Supply Connection	: Terminal block
Possible test case verdicts:	
- test case does not apply to the test object	: N/A
- test object does meet the requirement	: P(Pass)
- test object does not meet the requirement	: F(Fail)
Testing	:
Date of receipt of test item	: 14. 08. 2018
Date(s) of performance of tests	: 14. 08. 2018

General remarks:

The test results presented in this report relate only to the object tested.

This report shall not be reproduced, except in full, without the written approval of the Issuing testing laboratory.

"(see Enclosure #)" refers to additional information appended to the report.

Throughout this report a comma (point) is used as the decimal separator.

General product information

- See the technical document
- It is an existing authentication model, with a derived model added
- The difference in derived models is the size difference

[&]quot;(see appended table)" refers to a table appended to the report.

6	DEGREES OF PROTECTION AGAINST INGR		
	BY THE SECOND CHARACTERISTIC NUME	RAL	
	The second characteristic numeral indicates		Р
	the degree of protection provided by		
	enclosures with respect to harmful effects on		
	the equipment due to the ingress of water.		
	The tests for the second characteristic		Р
	numeral are carried out with fresh water. The		
	actual protection may not be satisfactory if		
	cleaning operations with high pressure and/or solvents are used.		
	Tab. III gives brief descriptions and definitions		Р
	of the protection for the degrees represented		
	by the second characteristic numeral.		
	Degrees of protection listed in Tab. III shall		Р
	be specified only by the second characteristic		
	numeral and not by reference to the brief		
	description or definition.		
	The tests are specified in Clause 14.		Р
	Up to and including second characteristic		Р
	numeral 6, the designation implies compliance		
	also with the requirements for all lower		
	characteristic numerals.		
	However, the tests establishing		Р
	compliance with any one of the lower degrees		'
	of protection need not necessarily be		
	carried out provided that these tests obviously		
	would be met if applied.		
	An enclosure designated with second		Р
	characteristic numeral 7 or 8 only is		•
	considered unsuitable for exposure to water		
	jets (designated by second characteristic		
	numeral 5 or 6) and need not comply with		
	requirements for numeral 5 or 6 unless it is		
	dual coded .		
	Enclosures for "versatile" application shall		Р
	meet requirements for exposure to both water		
	jets and temporary or continuous immersion.		
	Enclosures for "restricted" application are	See page 4	N/A
	considered suitable only for temporary or	Coo page !	
	continuous immersion and unsuitable		
	for exposure to water jets

7	DEGREES OF PROTECTION AGAINST ACCE INDICATED BY THE ADDITIONAL LETTER	ESS TO HAZARDOUS PARTS	
	The additional letter indicates the degree of protection of persons against access to hazardous parts.		N/A
	Additional letters are only used:		
	if the actual protection against access to hazardous parts is higher than that indicated by the first characteristic numeral;		N/A
	or if only the protection against access to hazardous parts is indicated, the first characteristic numeral being then replaced by an X		N/A
	For example, such higher protection may be provided by barriers, suitable shape of openings or distances inside the enclosure.		N/A
	Tab. IV gives access probes considered by convention as representative of parts of the human body or objects held by a person and the definitions for the degrees of protection against access to hazardous parts, indicated by additional letters.		N/A
	An enclosure shall only be designated with a stated degree of protection indicated by the additional letter if the enclosure also complies with all lower degrees of protection.		N/A
	However, the tests establishing compliance with any one of the lower degrees of protection need not necessarily be carried out provided that these tests obviously would be met if applied.		N/A

---	---	--

10	MARKING		
	The requirements for marking shall be specified in the relevant product standard.		N/A
	Where appropriate, such a standard should also specify the method of marking which is to be used when:		N/A
	one part of an enclosure has a different degree of protection to that of another part of the same enclosure		N/A
	the mounting position has an influence on the degree of protection		N/A
	the maximum immersion depth and time are indicated		N/A

11	GENERAL REQUIREMENTS FOR TESTS		
11.1	Atmospheric conditions for water or dust tes	sts	
	Unless otherwise specified in the relevant product standard, the tests should be carried out under the standard atmospheric conditions described in IEC 68-1.		Р
	The recommended atmospheric conditions during the tests are as follows		
	Temperature range: 15 to 35 °C Relative humidity: 25 to 75% Air pressure: 86 to 106 kPa (860 to 1060 mbar)		Р
	The tests specified in this standard are type tests.		Р
	Unless otherwise specified in a relevant product standard, the test samples for each test shall be in a clean and new condition, with all parts in place and mounted in the manner stated by the manufacturer.		Ρ
	If it is impracticable to test the complete equipment, representative parts or smaller equipment having the same full-scale design details shall be tested		N/A
	The relevant product standard shall specify details such as:		Р

12	TESTS FOR PROTECTION AGAINST ACCESS TO HAZARDOUS PARTS INDICATED BY THE FIRST CHARACTERISTIC NUMERAL		
12.1	Access probes		
	Access probes to test the protection of persons against access to hazardous parts are given in Tab. VI.		Р
12.2	Test conditions		
	The access probe is pushed against or (in case of the test for first characteristic numeral 2) inserted through any openings of the enclosure with the force specified in Tab. VI.		Р
	For tests on low-voltage equipment, a low-voltage supply (of not less than 40 V and not more than 50 V) in series with a suitable lamp should be connected between the probe and the hazardous parts inside the enclosure. Hazardous live parts covered only with varnish or paint, or protected by oxidation or by a similar process, are covered by a metal foil electrically connected to those parts which are normally live in operation.		Р
	The signal-circuit method should also be applied to the hazardous moving parts of high-voltage equipment.		N/A
	Internal moving parts may be operated slowly, where this is possibile.		N/A
12.3	Acceptance conditions		
	The protection is satisfactory if adequate clearance is kept between the access probe and hazardous parts.		Р
	For the test of first characteristic numeral 1, the access probe 50 mm diameter shall not completely pass through the opening.		Р

File/Ref. No.: 18STC-I-C-0005 Date: 16.08.2018 Page: 13 of 25 pages

Test Protocol

	IEC/EN 60529		
Clause	Requirement – Test	Result	Verdict
	For the test of first characteristic numeral 2, the jointed test finger may penetrate to its 80 mm length, but the stop face (Ø 50 ´ 20 mm) shall not pass through the opening. Starting from the straight position, both joints of the test finger shall be successively bent through an angle of up to 90° with respect to the axis of the adjoiningnsection of the finger and shall be placed in every possible position.		P
	See Annex A for further clarification. Adequate clearance means		Р
12.3.1	For low-voltage equipment (rated voltages no 1500 V d.c.)	ot exceeding 1000 V a.c. and	
	The access probe shall not touch hazardous live parts.		Р
	If adequate clearance is verified by a signal circuit between the probe and hazardous parts, the lamp shall not light.		Р
12.3.2	For high-voltage equipment (rated voltages e V d.c.)	exceeding 1000 V a.c. and 1500	_
	When the access probe is placed in the most unfavourable position(s), the equipment shall be capable of withstanding the dielectric tests as specified in the relevant product standard applicable to the equipment.		N/A
	Verification may be made either by dielectric test or by inspection of the specified clearance dimension in air which would ensure that the tests would be satisfactory under the most unfavourable electric field configuration (see IEC 71-2).		N/A
	In the case where an enclosure includes sections at different voltage levels the appropriate acceptance conditions for adequate clearance shall be applied for each section.		N/A
12.3.3	For equipment with hazardous mechanical p	parts	
	The access probe shall not touch hazardous mechanical parts.		N/A
	If adequate clearance is verified by a signal circuit between the probe and hazardous parts, the lamp shall not light.		N/A
13	TESTS FOR PROTECTION AGAINST SOLID INDICATED BY THE FIRST CHARACTERIST		
13.1	Test means		
	Test means and the main test conditions are given in Tab. VII. Tab. VII-7		Р

Test Protocol

IEC/EN 60529				
Clause	Requirement – Test	Result	Verdict	
	During the test, the moisture contained inside the enclosure may partly condense. The dew which may thus deposit shall not be mistaken for an ingress of water.		Р	
	For the purpose of the tests, the surface area of the enclosure is calculated with a tolerance of 10%.		Р	
	Adequate safety precautions should be taken when testing the equipment in the energized condition		N/A	
14.2.1	Test for second characteristic numeral 1 wit	h the drip box		
	The test is made with a device which produces a uniform flow of water drops over the whole area of the enclosure.		N/A	
	The turntable on which the enclosure is placed has a rotation speed of 1 r/min and the eccentricity(distance between turntable axis and specimen axis) is approximately 100 mm.		N/A	
	The enclosure under test is placed in its normal operating position under the drip box, the base of which is larger than that of the enclosure.		N/A	
	Except for enclosures designed for wall or ceiling mounting, the support for the enclosure under test should be smaller than the base of the enclosure.		N/A	
	An enclosure normally fixed to a wall or ceiling is fixed in its normal position of use to a wooden board having dimensions which are equal to those of that surface of the enclosure which is in contact with the wall or ceiling when the enclosure is mounted as in normal use.		N/A	
	The duration of test is 10 min.		N/A	
14.2.2	Test for second characteristic numeral 2 wit	th the drip box		
	The dripping device is the same as specified in 14.2.1 adjusted to provide the water flow rate specified in Tab. VIII.		N/A	
	The table on which the enclosure is placed does not turn as in the case of the test for the second characteristic numeral 1.		N/A	
	The enclosure is tested for 2,5 min in each of four fixed positions of tilt. These positions are 15° on either side of the vertical in two mutually perpendicular planes (see Fig. 3b)).		N/A	
	The total duration of the test is 10 min.		N/A

Test Protocol

	IEC/EN 60529		
Clause	Requirement – Test Result	Verdict	
	water pressure: to be adjusted to achieve the specified delivery rate;	N/A	
	core of the substantial stream: circle of approximately 40 mm diameter at 2,5 m distance from nozzle;	N/A	
	test duration per square metre of enclosure surface area likely to be sprayed: 1 min;	N/A	
	minimum test duration: 3 min;	N/A	
	distance from nozzle to enclosure surface:between 2,5 and 3 m	N/A	
14.2.6	Test for second characteristic numeral 6 with the 12,5 mm nozzle		
	The test is made by spraying the enclosure from all practicable directions with a stream of water from a standard test nozzle as shown in Fig. 6.	N/A	
	The conditions to be observed are as follows:.		
	internal diameter of the nozzle: 12,5 mm;	N/A	
	delivery rate: 100 l/min ± 5%;.	N/A	
	water pressure: to be adjusted to achieve the specified delivery rate;	N/A	
	core of the substantial stream: circle of approximately 120 mm diameter at 2,5 m distance from nozzle;	N/A	
	test duration per square metre of enclosure surface area likely to be sprayed: 1 min;	N/A	
	minimum test duration: 3 min;	N/A	
	distance from nozzle to enclosure surface: between 2,5 and 3 m.	N/A	
14.2.7	Test for second characteristic numeral 7: temporary immersion between 0,15 and 1 m		
	The test is made by completely immersing the enclosure in water in its service position as specified by the manufacturer so that the following conditions are satisfied:	_	
	a) the lowest point of enclosures with a height less than 850 mm is located 1000 mm below the surface of the water;	N/A	
	b) the highest point of enclosures with a height equal to or greater than 850 mm is located 150 mm below the surface of the water;	N/A	
	c) the duration of the test is 30 min;	N/A	
	d) the water temperature does not differ from that of the equipment by more than 5 K.	N/A	
	However, a modified requirement may be specified in the relevant product standard if the tests are to be made when the equipment is energized and/or its parts in motion	N/A	

File/Ref. No.: 18STC-I-C-0005 Date: 16.08.2018 Page: 21 of 25 pages

Test Protocol

	IEC	C/EN 60529	
Clause	Requirement – Test	Result	Verdict

14.2.8	Test for second characteristic numeral 8: continuous immersion subject to agreement	
	Unless there is a relevant product standard, the test conditions are subject to agreement between manufacturer and user,	Р
	but they shall be more severe than those prescribed in 14.2.7	Р
	And they shall take account of the condition that the enclosure will be continuously immersed in actual use.	Р
14.3	Acceptance conditions	
	After testing in accordance with the appropriate requirements of 14.2.1 to 14.2.8 the enclosure shall be inspected for ingress of water.	Р
	It is the responsibility of the relevant Technical Committee to specify the amount of water which may be allowed to enter the enclosure and the details of a dieletric strength test, if any.	Р
	In general, if any water has entered, it shall not:	
	be sufficient to interfere with the correct operation of the equipment or impair safety;	Р
	deposit on insulation parts where it could lead to tracking along the creepage distances;	Р
	reach live parts or windings not designed to operate when wet;	Р
	accumulate near the cable end or enter the cable if any.	Р
	If the enclosure is provided with drain-holes, it should be proved by inspection that any water which enters does not accumulate and that it drains away without doing any harm to the equipment.	N/A
	For enclosures without drain-holes, the relevant product standard shall specify the acceptance conditions if water can accumulate to reach live parts	Р

15	TESTS FOR PROTECTION AGAINST ACCESS TO HAZARDOUS PARTS INDICATED BY THE ADDITIONAL LETTER	
15.1	Access probes	
	Access probes to verify the protection of persons against access to hazardous parts are given in Tab. VI.	N/A
15.2	Test conditions	
15.	The access probe is pushed against any openings f the enclosure with the force specified in Tab. VI.	N/A

File/Ref. No.: 18STC-I-C-0005
Date: 16.08.2018
Page: 22 of 25 pages

Test Protocol

	IEC/EN 60529		
Clause	Requirement – Test	Result	Verdict
	If it partly or fully penetrates, it is placed in every possible position, but in no case shall the stop face fully penetrate through the opening.		N/A
	Internal barriers are considered part of the enclosure as defined in 3.1.		N/A
	For tests on low-voltage equipment, a low-voltage supply (of not less than 40 V and not more than 50 V) in series with a suitable lamp should be connected between the probe and the hazardous parts inside the enclosure.		N/A
	Hazardous live parts covered only with varnish or paint, or protected by oxidation or by a similar process, are covered by a metal foil electrically connected to those parts which are normally live in operation.		N/A
	The signal-circuit method should also be applied to the hazardous moving parts of high-voltage equipment.		N/A
	Internal moving parts may be operated slowly, where this is possible.		N/A
15.3	Acceptance conditions		
	The protection is satisfactory if adequate clearance is kept between the access probe and hazardous parts.		N/A
	In the case of the test for the additional letter B, the jointed test finger may penetrate to its 80mm length, but the stop face (Ø 50 x20 mm)shall not pass through the opening.		N/A
	Starting from the straight position, both joints of the test finger shall be successively bent through an angle of up to 90° with respect to the axis of the adjoining section of the finger and shall be placed in every possible position.		N/A
	In case of the tests for the additional letters C and D, the access probe may penetrate to its full length, but the stop face shall not fully penetrate through the opening.		N/A
	See Annex A for further clarification.		N/A
	Conditions for verification of adequate clearance are identical with those given in 12.3.1, 12.3.2 and 12.3.3.		N/A
